This solution uses command –mkdir and -mkdir –p, in the first case I need always to be in the parent directory and then to write the command –mkdir and then the name of the new directory I want to create, in the second case I don't need to be in the parent directory but using –p I can write the absolute path in which I want to create my new directory like I did in the last line of this exercise.

In order to implement the first solution I needed also command –cd which allows me to mve inside and outside different directories.
